

M AIR mixer firmware

Version 1.17 - (24 April 2018)

Firmware V 1.17 for MIDAS M-AIR series mixers

The M-AIR Firmware Update V 1.17 includes performance enhancements to your M-AIR mixer's operating system.

MIDAS is constantly adding features and making enhancements to this extremely stable operating system, so that you always experience the best possible performance from your M-AIR Mixer. Check out midasconsoles.com for updates regularly.

Note: The M-AIR EDIT application for PC (Win/Mac/Linux) can be used for updating your M-AIR mixer's firmware. Download and unpack the MR18 or MR12 firmware update file from midasconsoles.com, and connect your PC with your M-AIR mixer in the same (wired or wireless) network. Then open the M-AIR EDIT Setup/connection page and select your M-AIR mixer from the list box. The current firmware version installed on your mixer will be displayed right below the list box. Click on 'Update FW', select the file "*_firmware_1.17.update" and click 'Open'. After the firmware has been installed successfully and the mixer is rebooted, you can connect to it and synchronise as usual.

Please note: It is generally recommended to save important settings as scenes or presets on your control device, before updating the firmware.

NEW FEATURES

- n/a

ENHANCEMENTS

- Fixed channel swap when soloing linked buses
- Fixed auto mute when using very specific PEQ (parametric equaliser) settings
